

Key Findings & Interpretation

1. Which features influence house price the most?

Ans: The most influential features are-

- Area (sq ft) is the strongest predictor of price.
- Bathrooms, air conditioning, stories, and parking also have a strong positive impact on price.

2. How accurate was your model (in plain terms)?

Ans: Model Accuracy (Plain Terms)

- Linear Regression explains ~65% of the variation in house prices ($R^2 = 0.65$). On average it is off by about ₹970K per house — reasonable for a simple model on this price range (₹1.75M - ₹13.3M).

3. What surprised you in the data?

Ans: The surprising findings are-

- Air conditioning alone has a stronger correlation with price than the number of bedrooms — suggesting comfort features are priced highly in this market.
- Linear Regression outperformed Random Forest here, which is unusual but happens when relationships are mostly linear and the dataset is small (545 rows).

4. One recommendation for a real estate business based on your findings

Ans: Recommendation for a Real Estate Business

- Focus marketing and renovation investment on area expansion, adding bathrooms, and installing AC— these features yield the highest price premium. Bedrooms matter less than expected; quality of amenities drives price more than quantity of rooms.
